

*When you quickly pull off couple of card on the lowest part of the cardhouse it doesn't collapse immediately because of the inertia.*

*The electric Formula-1 toy car doesn't stay on its track when you press turbo button but it flies off because the mass of Formula-1 car tries to keep going to its original direction -> inertia*

*When you have done your dishes and you take the bung out the water start to spin because of the coriolis effect and the lather starts to spin too. Still the water starts to spin like that its trying to pack to the sides of the washbasin unlike the lather, which is packing to central of the whirlpool. Inertia is shown to this picture by this effect, because inertia does more significance to the water since it's density is bigger.*
